

Customer Support Knowledge Base — Technical Support & Integrations

Synthetic support articles covering APIs, authentication, webhooks, OAuth, imports, exports, synchronization, and third-party integrations.

Article count: 40

KB-001 — API key creation

Common question: How do I handle api key creation?

Resolution: API key creation should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-002 — API key rotation

Common question: How do I handle api key rotation?

Resolution: API key rotation should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-003 — API key revocation

Common question: How do I handle api key revocation?

Resolution: API key revocation should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-004 — API authentication failure

Common question: How do I handle api authentication failure?

Resolution: API authentication failure should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-005 — Rate limit reached

Common question: How do I handle rate limit reached?

Resolution: Rate limit reached should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-006 — API request timeout

Common question: How do I handle api request timeout?

Resolution: API request timeout should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-007 — API response error

Common question: How do I handle api response error?

Resolution: API response error should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-008 — Webhook setup

Common question: How do I handle webhook setup?

Resolution: Webhook setup should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-009 — Webhook delivery failure

Common question: How do I handle webhook delivery failure?

Resolution: Webhook delivery failure should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result

before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-010 — Webhook signature verification

Common question: How do I handle webhook signature verification?

Resolution: Webhook signature verification should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-011 — Webhook retries

Common question: How do I handle webhook retries?

Resolution: Webhook retries should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-012 — Webhook event duplication

Common question: How do I handle webhook event duplication?

Resolution: Webhook event duplication should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-013 — OAuth connection

Common question: How do I handle oauth connection?

Resolution: OAuth connection should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-014 — OAuth authorization failure

Common question: How do I handle oauth authorization failure?

Resolution: OAuth authorization failure should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-015 — OAuth token expiration

Common question: How do I handle oauth token expiration?

Resolution: OAuth token expiration should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-016 — OAuth token refresh

Common question: How do I handle oauth token refresh?

Resolution: OAuth token refresh should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-017 — Third-party integration setup

Common question: How do I handle third-party integration setup?

Resolution: Third-party integration setup should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-018 — Integration permissions

Common question: How do I handle integration permissions?

Resolution: Integration permissions should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-019 — Integration disconnected

Common question: How do I handle integration disconnected?

Resolution: Integration disconnected should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-020 — Reconnect integration

Common question: How do I handle reconnect integration?

Resolution: Reconnect integration should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-021 — Importing CSV data

Common question: How do I handle importing csv data?

Resolution: Importing CSV data should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-022 — CSV import validation

Common question: How do I handle csv import validation?

Resolution: CSV import validation should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-023 — CSV encoding issue

Common question: How do I handle csv encoding issue?

Resolution: CSV encoding issue should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before

retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-024 — Duplicate imported records

Common question: How do I handle duplicate imported records?

Resolution: Duplicate imported records should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-025 — Exporting data

Common question: How do I handle exporting data?

Resolution: Exporting data should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-026 — Scheduled export

Common question: How do I handle scheduled export?

Resolution: Scheduled export should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-027 — Data synchronization

Common question: How do I handle data synchronization?

Resolution: Data synchronization should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-028 — Sync conflict

Common question: How do I handle sync conflict?

Resolution: Sync conflict should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-029 — Integration field mapping

Common question: How do I handle integration field mapping?

Resolution: Integration field mapping should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-030 — Required integration fields

Common question: How do I handle required integration fields?

Resolution: Required integration fields should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-031 — Unsupported data type

Common question: How do I handle unsupported data type?

Resolution: Unsupported data type should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-032 — Pagination in API

Common question: How do I handle pagination in api?

Resolution: Pagination in API should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-033 — API version compatibility

Common question: How do I handle api version compatibility?

Resolution: API version compatibility should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-034 — Sandbox or test environment

Common question: How do I handle sandbox or test environment?

Resolution: Sandbox or test environment should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-035 — Production environment configuration

Common question: How do I handle production environment configuration?

Resolution: Production environment configuration should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-036 — Service account access

Common question: How do I handle service account access?

Resolution: Service account access should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-037 — IP allowlist configuration

Common question: How do I handle ip allowlist configuration?

Resolution: IP allowlist configuration should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-038 — Integration audit logs

Common question: How do I handle integration audit logs?

Resolution: Integration audit logs should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-039 — Integration troubleshooting

Common question: How do I handle integration troubleshooting?

Resolution: Integration troubleshooting should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.

KB-040 — Integration support escalation

Common question: How do I handle integration support escalation?

Resolution: Integration support escalation should be handled through the supported account, product, or service workflow. Review the current status, follow the documented recovery or configuration steps, and confirm the result before retrying.

Recommended steps: Verify the relevant settings or status; reproduce the issue once using the official workflow; record any exact error message or reference number.

Escalation: Escalate when the documented workflow fails, the issue persists after the basic checks, or account ownership, billing, privacy, or security review is required.
